Scan. Check. Ship.

A clear identity for code security, backed by evidence.

ShipCheck

CODE SECURITY

Scan. Check. Ship.

The promise

Help developers move from a security finding to a reviewed fix, with evidence from the checks that actually ran.

One mark. One clear meaning.

The code window identifies the subject. The check badge signals the workflow.

Name

Always ShipCheck. Keep the internal capital C; no space.

Slogan

Scan. Check. Ship. Use sentence case and all three full stops.

Descriptor

Use CODE SECURITY on first-touch materials. Omit it only where the product is already familiar.

Logo variations

Choose a lockup for the available space; do not compress it to fit.

Compact / product navigation

Stacked / narrow placements

Single colour / one-ink output

App icon / simplified favicon

Colour with a job to do

Brand colours build recognition. Semantic colours communicate a specific status.

Navy

#142b45

Headings, navigation

Blue

#2563eb

Actions, focus, links

Teal

#0f766e

Verified test result

Mint

#5eead4

Accent on navy

Canvas

#f8fafc

Background

Navy on white: 14.37:1 contrast

White on blue: 5.17:1 contrast

White on teal: 5.47:1 contrast

Mint on navy: 9.71:1 contrast

All listed text pairs exceed 4.5:1. Do not use mint text on white. Danger uses #b91c1c; warning uses #92400e. Always pair status colour with a label and icon.

Typography and layout

Calm, legible and direct. Information comes before decoration.

ShipCheck

Wordmark: Arial Bold / tight spacing

Findings you can investigate.

Clear evidence. Bounded tests. Human review.

Product UI: retain Figtree, with Arial and sans-serif fallbacks. Use weights 400, 600 and 700. Use a system monospace for code, hashes and timestamps. Fonts are not bundled.

Type scale: 12 / 14 / 16 / 20 / 24 / 32 / 48 px. Body text: 16 px with 1.5 line height. Spacing: 4 / 8 / 12 / 16 / 24 / 32 / 48 / 64 px. Controls: 8 px radius. Cards: 16 px radius.

Use visible keyboard focus, explicit labels, readable tables and text explanations for every status.

Use the logo consistently

Protect recognition, readability and the meaning of the check.

Clear space

Keep at least one-quarter of the code window height empty on all sides. The supplied SVG artboard is not a substitute for layout padding.

Minimum sizes

Full lockup: 320 px wide. Compact: 180 px wide. Standalone symbol: 48 px. Below that, use the simplified favicon, down to 16 px.

Backgrounds

Primary mark on white or canvas; reversed mark on navy. Use monochrome versions for one-colour printing. Keep photos behind a solid holding panel.

Avoid

Do not stretch, rotate, recolour, add shadows or remove the code window. Do not place the badge on unrelated findings as a universal approval stamp.

Voice and evidence

Confident about the observed result. Precise about its limits.

Product introduction

ShipCheck helps developers investigate code-security findings, test supported fixes in isolation, and review the evidence before opening a pull request.

Good result copy

The selected dependency advisory was not detected after the patch. The configured tests passed. Review the diff and evidence before merging.

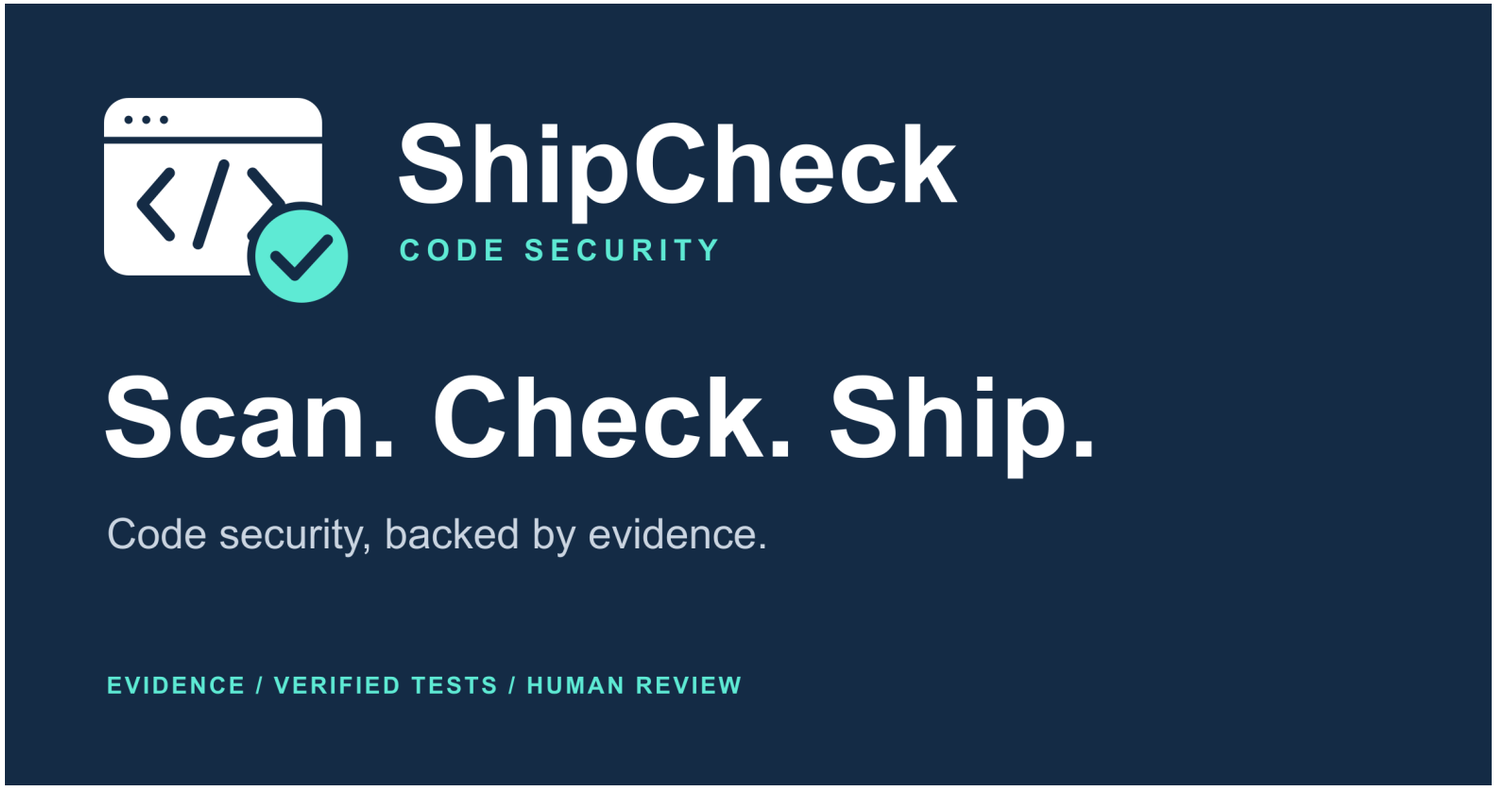

Avoid

Do not say: 100% secure, all vulnerabilities fixed, certified compliant, or safely shipped unless the exact claim has independent supporting evidence.

The slogan is a workflow invitation. ShipCheck does not turn a passed test into automatic permission to merge or deploy.

Ready-to-use applications

Use the supplied assets to keep the demo, social posts and product consistent.

Social / link preview: 1200 x 630. App icon: 512 x 512 SVG master. Raster exports at 2x.

Package: editable SVGs, transparent PNGs, favicon.ico, CSS and JSON tokens, this guide and regenerable source files. These assets have not been applied to the live app.
